

Applied Computing

Springer-Verlag London Ltd.

The Springer-Verlag Series on Applied Computing is an advanced series of innovative textbooks that span the full range of topics in applied computing technology.

Books in the series provide a grounding in theoretical concepts in computer science alongside real-world examples of how those concepts can be applied in the development of effective computer systems.

The series should be essential reading for advanced undergraduate and postgraduate students in computing and information systems.

Books in this series are contributed by international specialist researchers and educators in applied computing who draw together the full range of issues in their specialist area into one concise authoritative textbook.

Titles already available:

Deryn Graham and Anthony Barrett
Knowledge-Based Image Processing Systems
3-540-76027-X

Derrick Morris, Gareth Evans, Peter Green, Colin Theaker
Object Orientated Computer Systems Engineering
3-540-76020-2

John Hunt
Java and Object Orientation: An Introduction
3-540-76148-9

David Gray
Introduction to the Formal Design of Real-Time Systems
3-540-76140-3

Mike Holcombe and Florentin Ipaté
Correct Systems: Building A Business Process Solution
3-540-76246-9

Jan Noyes and Chris Baber
User-Centred Design of Systems
3-540-76007-5

Preface

With the continuing evolution and convergence of previously disparate technologies around electronic commerce, the World Wide Web is increasingly pervasive in the corporate value chain. Most business processes, from procurement and inbound logistics to marketing and after-sales service, create and use information (Porter 1998, 167f.). They are connected via networked information systems, which have become the basic infrastructure for global transaction-oriented applications. Every transaction process occurring in such an electronic marketplace goes hand in hand with the access, absorption, arrangement, and selling of information in heterogeneous ways (Zakon 1999).

Despite these technological and organizational changes, the customers' information needs provide a uniform purpose for Web information systems. Accordingly, developers of such systems have to analyze the requirements of the newly empowered and technologically savvy customers in order to exploit the potential of online trading of information, services, and physical goods.

This book presents a methodology for analyzing and developing Web information systems that considers the structural changes in electronic markets outlined above. Chapter 1 defines the field and introduces the term “ergodic literature” for textual material whose access and utilization requires non-trivial efforts by the reader. It identifies navigational and textual features of interactive Web applications, a subset of ergodic literature, and compares these features with those of printed media. An analysis of the multifaceted term “interactivity” then sets the stage for Chapter 2, which investigates the life-cycle economies and diffusion characteristics of traditional and Web-based applications. The subsequent sections delineate the evolution of electronic markets in general and the World Wide Web in particular from both Darwinian and methodological perspectives. To investigate this process, an evolutionary framework based on system adaptivity and the underlying communication patterns is introduced. It classifies Web information systems and analyzes their ability to support the various phases of electronic business transactions. Only advanced system architectures can fully leverage the potential of the World Wide Web to deliver additional customer value. The framework specifies the following four categories: Static Web information systems that provide basic information of limited value for the average customer (→ Chapter 3), interactive systems that enable explicit customer feedback and transaction processing (→ Chapter 4), adaptive systems that instantly and automatically generate the hyper-

text structure according to embedded user models (↪ Chapter 5), and agent-mediated architectures that allow individual negotiations regarding product and non-product attributes (↪ Chapter 6).

Chapter 3 summarizes the characteristics of static Web information systems. These collections of rudimentary hypertext documents are still common for many small and medium-sized companies. More in line with current business practices of larger organizations, Chapter 4 focuses on gathering customer feedback and its immediate analysis within an iterative cycle of design, implementation, usage, and analysis. The emergent attributes of modern organizations suggest such an evolutionary approach to Web development. Analytic activities are no longer captured within the early stages of a system's life-cycle but represent a continuing task of system maintenance. Analysis, operation, and maintenance activities become parallel but highly interrelated processes. Cyclical planning is rendered obsolete, since the results of the ongoing analysis are continuously fed into the maintenance phase. Section 4.2 outlines the current state of Web engineering with special regard to design methodologies, conceptual modeling approaches, and related visualization techniques. It introduces a symbolic modeling language for the construction of both reference and customized models during the development process of commercial Web information systems (↪ Section 4.3). This graphical notation helps analysts to visualize individual and aggregated access patterns of online customers derived from log file data of corporate Web servers. It enhances the limited, statistically oriented representations of commercially available Web-tracking software with a map-like overview similar to customer tracking in traditional retailing outlets (↪ Section 4.4).

Numerous tools support the structured design of Web information systems, ranging from rudimentary layout products for individual documents to sophisticated Web site management solutions that facilitate conceptual authoring-in-the-large. Structured analysis, by contrast, has largely been neglected by both theory and practice but belongs to the most relevant questions in formulating business strategies for electronic commerce. This comes as a surprise, since analysis is less constrained by the technical limitations of existing architectures. Section 4.5 intends to fill this gap by suggesting a methodology for the automated analysis of Web information systems. The chapter summarizes empirical results covering several business sectors, namely information technology, travel and tourism, retail banking, and environmentally oriented non-profit organizations. Classifications, comparative sector assessments, longitudinal studies, and exploratory textual analyses help practitioners chart the industry evolution and compare the performance of their own Web information system with those of competing organizations.

Chapter 5 introduces adaptive Web information systems that promise a sustainable competitive advantage in an environment where information redundancy becomes increasingly evident. Such a competitive advantage can only be achieved through customizing products, services, and communications. Key elements of customization are the separation of product and process life-cycles as described in Section 5.1. The resulting “classic loop of adaptation”, delineated in Section 5.2, is founded on the continuing gathering of information regarding the customers’ current needs and preferences. Sections 5.3 and 5.4 compare explicit and implicit acquisition methods and describe ways to combine the various information sources and transform the resulting body of knowledge into consistent user models. On the basis of such embedded user models, adaptive Web information systems can automatically generate the content of documents, the primary navigational system comprising links between and within these documents, and supplemental navigational systems such as index pages, trails, guided tours, or interactive site maps. Many prototypes that incorporate adaptive components are developed without a clear model of the components’ functionality. Therefore, Section 5.5 provides a conceptual guideline for the development process by classifying the various mechanisms into content-level, link-level, and meta-level adaptation.

In the fourth and last stage of Web evolution, which is portrayed in Chapter 6, efforts to automate and optimize electronic business-to-consumer transactions gradually transfer certain tasks from adaptive Web information systems to agent-mediated architectures. Many deployed applications use content-based information agents and collaborative filtering systems for general information retrieval or specific product recommendations (↪ Sections 6.1 and 6.2). By contrast, most transaction agents are only available as prototypical implementations up until now (↪ Section 6.3). Transaction agents allow multidimensional negotiations regarding a variety of product and non-product attributes. Once the necessary infrastructure is in place (↪ Section 6.4), their customizability and remarkable flexibility promise to change the inherent characteristics of doing business electronically.

Acknowledgements

I have been helped in various ways with the conceptual planning of this book, the gathering of the empirical data, the compilation of results, and with the production of the final manuscript. My first debt of gratitude is to Hans Robert Hansen and Hannes Werthner for encouraging and helping me through the process of writing this book. Their suggestions and critical observations have led to innumerable improvements. I

also owe special thanks to Bernard Glasson and Arie Segev for their generous support during my time as visiting research fellow at the Curtin University of Technology and the University of California at Berkeley, respectively.

The successful completion of a project such as this is not possible without the feedback of many colleagues. First of all, I would like to mention Christian Bauer, to whom I am greatly indebted for his invaluable help. Several analyses presented in this book originate from our joint research efforts over the last two years. I would also like to thank my home institution, the Information Systems Department of the Vienna University of Economics and Business Administration, for granting me the resources and intellectual support necessary to finish this project. The cooperation with my colleagues Martin Bichler, Roman Brandtweiner, and Marion Kaukal contributed to important aspects of my research. Thanks also go to Judith Gebauer, with whom I have been fortunate to work at the University of California at Berkeley.

I apologize to the people I have omitted to acknowledge, and also – in the event that their ideas have been misrepresented – to those whom I have acknowledged. I would also like to recognize the considerable financial support from the Austrian Science Fund and the Austrian National Bank. Finally, I would like to thank Rebecca Mowat and the staff at Springer London for their support and help in the materialization of this book.

Vienna, July 2000

Table of Contents

1 Introduction	1
1.1 Formal Definitions of Text	2
1.1.1 The Metaphysics of Written Text	2
1.1.2 Technological Implications for the Discursive Space	4
1.2 Ergodic Literature.....	5
1.3 Hypertext and Hypermedia.....	6
1.3.1 History	7
1.3.2 Adaptability versus Adaptivity	9
1.4 Web Information Systems	10
1.4.1 Theories of Communication	11
1.4.2 Media Characteristics of the World Wide Web	13
1.4.3 Evolving Web Genres.....	14
1.4.4 Structure and Navigation	15
1.4.4.1 The Myth about Linearity	16
1.4.4.2 The Labyrinth Metaphor.....	17
1.4.5 Textual Characteristics	18
1.4.5.1 Differences between Printed and Electronic Media.....	20
1.4.5.2 Mapping Textons to Scriptons	22
1.4.6 Interactivity: An Ambiguous Term	23
1.4.6.1 Media Permeability.....	24
1.4.6.2 Communication Patterns.....	25
1.4.6.3 Discourse Structure	25
2 The Evolution of Electronic Markets	27
2.1 Darwinian versus Technological Evolution.....	28
2.1.1 Alternative Life-Cycle Economies	32
2.1.1.1 Prototyping.....	32
2.1.1.2 Organizational Emergence.....	33
2.1.1.3 Types of Maintenance	34
2.1.1.4 Stable System Drag	36
2.1.2 Electronic Business Ecosystems	37
2.1.2.1 Autopoietic Self-Reference	38
2.1.2.2 Chronological Development and Demarcation	38
2.1.2.3 Critical Mass of Content and Adopters	40

2.2	A Brief History of Web Adaptivity	40
2.2.1	Stage Models for Describing Web Evolution.....	42
2.2.2	Diffusion of Web Technology	45
2.2.2.1	Temporal Pattern of the Diffusion Process.....	45
2.2.2.2	Rate of Adoption	47
2.3	Electronic Market Transactions.....	49
2.3.1	Evaluating Transactional Infrastructures.....	53
2.3.2	Redefining the Customer-Delivered Value	55
2.3.3	Extending the Evaluation Model	59
2.3.4	Electronic Customer Relations	61
2.3.4.1	Customizing Corporate Communication.....	61
2.3.4.2	Gathering and Representing Customer Information	63
3	A Static World	67
4	The Emergence of Interactivity	71
4.1	Overview	72
4.1.1	Development Process.....	72
4.1.2	Database Connectivity	73
4.1.3	Presentational versus Semantic Markup Languages	74
4.1.4	Traversal Functions.....	76
4.2	Design: The Current State of Web Engineering	77
4.2.1	Processing and Visualizing Complex Information.....	77
4.2.2	Cooperative Web Development.....	80
4.2.3	Review of Existing Design Methodologies.....	82
4.2.4	The Extended World Wide Web Design Technique.....	84
4.2.4.1	Information Object Types.....	87
4.2.4.2	Diagram Structuring.....	89
4.2.4.3	Navigation Design.....	90
4.2.5	Application of eW3DT (Electronic Shopping Mall)	91
4.3	Implementation: Industry-Specific Reference Models.....	94
4.3.1	Definition and Overview.....	94
4.3.2	Deducing Customized and Technical Models.....	94
4.3.3	Removing Communication Barriers	96
4.4	Usage: Visualizing Topology and Access Patterns	98
4.4.1	Categories of Perceptualization	98
4.4.2	Observing and Visualizing Human Behavior.....	99
4.4.3	Units of Analysis.....	100
4.4.4	Tool Support	103

4.5 Analysis: Gathering, Extracting, and Processing of Multidimensional Web Data	106
4.5.1 Overview and Analytical Objectives.....	107
4.5.2 Manual versus Automated Evaluation.....	109
4.5.2.1 Previous Web Evaluation Projects	109
4.5.2.2 Web Classification Frameworks.....	113
4.5.2.3 Integrative Analysis of Content and Form.....	115
4.5.3 Methodology	116
4.5.3.1 Sampling Process	118
4.5.3.2 Mirroring and Archiving Web Data.....	121
4.5.3.3 Structural Parameters.....	122
4.5.3.4 Textual Parameters	126
4.5.3.5 Combining and Pre-Processing the Extracted Parameters	127
4.5.4 Validating Manual Evaluations of the LSE/Novell Survey	131
4.5.4.1 Introduction to Neural Networks	131
4.5.4.2 Test Design	133
4.5.4.3 Results	135
4.5.4.4 Discussion.....	137
4.5.5 Snapshot Analysis (Classification)	139
4.5.5.1 Partitioning Clustering.....	140
4.5.5.2 Results	142
4.5.5.3 Discussion.....	145
4.5.5.4 Hierarchical Clustering	146
4.5.6 Cross-Sectional Analysis	147
4.5.6.1 Structure and Navigation	148
4.5.6.2 Interface Representation.....	150
4.5.6.3 Content and Strategy	152
4.5.7 Longitudinal Analysis	154
4.5.8 Exploratory Textual Analysis.....	156
4.5.8.1 Types of Content	159
4.5.8.2 Common Methods for Describing and Analyzing Textual Data.....	160
4.5.8.3 Word List Generation.....	161
4.5.8.4 Lemmatization	164
4.5.8.5 Keyword Analysis	165
4.5.8.6 Concordance Analysis and Collocation.....	170
4.5.8.7 Analysis of Contingency Tables	173
5 Adaptive Solutions.....	183
5.1 Separating Product and Process Life-Cycles	185

5.2 Classic Loop of Adaptation	188
5.3 Collecting Information About Users	190
5.3.1 Available Online Sources.....	192
5.3.2 Explicit Acquisition Methods.....	193
5.3.3 Implicit Acquisition Methods	194
5.4 User Modeling.....	197
5.4.1 Characteristics of User Models	199
5.4.2 Typology of the Extra-Linguistic Context	202
5.4.3 Building and Initializing User Models	204
5.5 Adaptive Web Presentation Techniques.....	206
5.5.1 Annotations	207
5.5.1.1 Historical Background	208
5.5.1.2 Automated Document Annotation	209
5.5.2 Content-Level Adaptation	210
5.5.2.1 Deictic Expressions.....	211
5.5.2.2 Expressing Shared Meaning.....	211
5.5.2.3 Techniques for Generating and Arranging Scriptons	212
5.5.3 Link-Level Adaptation	214
5.5.4 Meta-Level Adaptation	217
5.5.4.1 Site Maps.....	219
5.5.4.2 View Types.....	221
5.5.4.3 View Transformations.....	226
5.5.4.4 Implications for Hypertext Navigation	227
6 Agent-Mediated Architectures	233
6.1 Content-Based Information Agents	234
6.2 Collaborative Filtering	236
6.3 Transaction Agents.....	238
6.4 Developing Digital Agents	242
6.4.1 Agent Communication Models.....	242
6.4.2 Traversal Functions of Agent-Mediated Architectures.....	244
6.4.3 Modeling Multilateral Interactions	245
7 Conclusion and Outlook	247
